Gel Extraction Protocol

1. Gel Dissociation

Excise the agarose gel slice containing relevant DNA fragments and remove any extra agarose to minimize the size of the gel slice. Transfer up to 300 mg of the gel slice to a 1.5 ml microcentrifuge tube. Add **500 µl of QG Buffer** and mix by vortex. Incubate at 55-60ºC for 10-15 minutes to ensure the gel slice has been completely dissolved. During incubation, invert the tube every 2-3 minutes. If the color of the mixture has turned to purple, add 10 µl of 3M Sodium Acetate (pH5.0) and mix thoroughly. Cool the dissolved sample to room temperature.

2. DNA Binding

Place a **DFH Column** in a **2 ml Collection Tube**. Transfer **800 µl of the sample mixture** to the **DFH Column**. Centrifuge at 14-16,000 x g for 30 seconds. Discard the flow-through and place the **DFH Column** back in the **2 ml Collection Tube**. If the sample mixture is more than 800 µl, repeat the DNA Binding step.

3. Wash

Add **400 µl of W1 Buffer** into the **DFH Column**. Centrifuge at 14-16,000 x g for 30 seconds then discard the flow-through. Place the **DFH Column** back in the **2 ml Collection Tube**. Add **600 µl of Wash Buffer** (make sure ethanol was added) into the **DFH Column**. Let stand for 1 minute at room temperature. Centrifuge at 14-16,000 x g for 30 seconds then discard the flow-through. Place the **DFH Column** back in the **2 ml Collection Tube**. Centrifuge at 14-16,000 x g for 3 minutes to dry the column matrix.

4. DNA Elution

Transfer the dried **DFH Column** to a new 1.5 ml microcentrifuge tube. Add **20-50 µl of (60-70ºC) pre-heated Elution Buffer** or TE into the center of the column matrix. Let stand for at least 2 minutes to ensure the **Elution Buffer** is completely absorbed. Centrifuge for 2 minutes at 14-16,000 x g to elute the purified DNA.
